Figure 1. The effect of the concentration of the *Agrobacterium* suspension on the transformation efficiency of *Agrobacterium* strains. The *Agrobacterium* strains were incubated with the plant explants for 24 h. The explants were then cultured on the selective medium. The number of explants transformed was counted. The results are expressed as the mean $\pm$ SD of three independent experiments. The data were analyzed by the Student's *t*-test. The difference between the control and the experimental groups was significant at $p < 0.05$.

The image displays a highly detailed and colorful abstract pattern, likely a microscopic view of a biological specimen. The pattern is dense and irregular, featuring a variety of colors including shades of green, yellow, and red. The structures appear to be composed of many small, distinct units, possibly cells or molecules, arranged in a complex, non-uniform manner. The overall appearance is that of a high-magnification micrograph or a detailed scientific illustration, possibly showing a cross-section of a tissue or a specific cellular component. The pattern is characterized by its intricate details and the way the different colors and shapes intermingle, creating a rich, textured visual effect.
